APPLICATION DEVELOPMENT

(WBL)

ASSIGNMENT 1:

DAILY ACTIVITIES RECORDER

APPLICATION

Lecturer : Dr. Ahmad Najmi bin Amirhaider Nuar

Name	Matric No.
Damiya Aina binti Basir Abd Shammad	A23CS0220

1. Title of the assignment

Design and Development of a Daily Activities Recorder using Flutter

2. Objective

- 1.1. To create an easy-to-use mobile application that lets users record, view and manage their daily activities.
- 1.2. Aims to help users stay organized by providing a convenient way to input activities along with their time or category, and to update or delete them when necessary.

3. Brief Description of The System

This system is a straightforward Flutter-built activity management application. Users can enter daily activities and keep them in a structured list manner. Every activity has a name and further information, like the time or category.

A delete option allows users to continuously add new activities and erase any that already exist. When modifications are performed, the interface is instantly updated by the real-time system. Users can easily engage with the program thanks to its neat and organized design.

4. Explanation of the Interface

Activity Input Field

The task name that the user wishes to record is entered into the activity input area. Users describe their activity in this primary input.

Time/Category Input Field

Users can enter more details about the activity in this field. It may indicate the activity's nature or category or the time it is scheduled.

Add Activity Button

The Add Activity button stores the entered data by acting as a trigger. When an activity is clicked, it is added to the list and the interface is refreshed to display the new entry.

Activity List

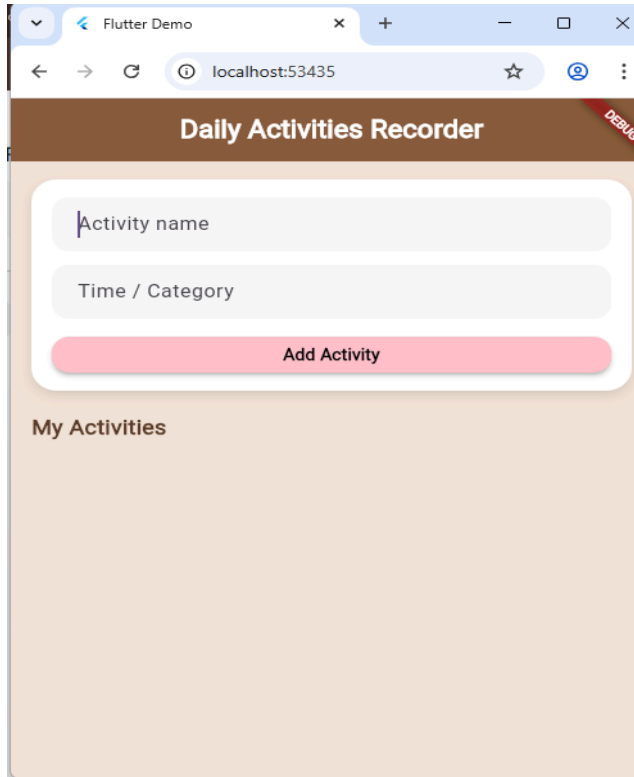

All of the recorded activities are displayed in the activity list. It helps users keep track of the tasks they have added by giving them a clear overview.

Delete Button (Icon)

Users can remove particular actions from the list by using the delete icon. By eliminating chores that are no longer required, this functionality guarantees that users may efficiently manage their entries.

5. Screenshot of The App

Main Layout Screen

Example of Added Activities

The screenshot shows a web browser window with the title 'Flutter Demo' and the address 'localhost:53435'. The app interface has a brown header with the title 'Daily Activities Recorder'. Below the header is a form with two input fields: 'Activity name' and 'Time / Category', followed by a pink 'Add Activity' button. Under the form is a section titled 'My Activities' containing a list of four activities, each in a white card with a red trash icon on the right:

- sleep
9.00 pm
- eat
10.00 am
- movie time
2.00 pm
- swimming

Updated List after Deletion (delete Movie Time)

The screenshot shows the same web browser window. The app interface is identical to the previous one, but the 'My Activities' list now contains four activities, with 'movie time' removed and 'study' added at the bottom:

- sleep
9.00 pm
- eat
10.00 am
- swimming
6.00 pm
- study

6. Conclusion

In conclusion, this project effectively illustrates how Flutter can be used to create a simple activity tracking application. Through straightforward interactions like adding and removing entries, the system enables users to easily manage their duties.

Additionally, this task improves comprehension of Flutter programming, especially with regard to managing user input and dynamically modifying the user interface.
